

Top winterizing tasks for your home

(BPT) - If you shudder at the thought of shivering through another frigid winter, building industry experts say now is the time to consider winterizing your home. Several simple and cost-effective measures can yield both immediate and long-term benefits.

While instinct may prod you to increase the heat during winter and keep your home toasty all day long, that's not always cost-effective. Investing in a programmable thermostat allows you to adjust the temperature remotely, lowering the setting when the house is empty, and save money in the process. Modern thermostats let you monitor the indoor temperature of your home remotely via your smartphone or online. By keeping the temperature low when no one is home and programming the thermostat to increase the temperature when everyone arrives home, you could notice a 10 percent drop in your heating costs.

Fall is also an ideal time to ensure your furnace is functioning optimally. Schedule an appointment for a professional to inspect and clean your furnace once a year. By doing so, you'll help your furnace function more effectively and last longer.

If ice damming on the roof is an annual problem, consider taking measures to

completely stop dams from forming. Major damage can result from ice damming, so it's never too early to start thinking about a long-term solution. Ice damming occurs when warm, indoor air escaping through the roof melts snow on the shingles. The water then refreezes as it runs off the roof, creating a barrier of ice at the edge. Shovelling snow or chipping ice away can threaten life, limb and roof, so it's best to consider more permanent solutions.

While caulking or weather-stripping can help address the gaps allowing the air to escape, the U.S. Department of Energy's Home Energy Saver website says that proper air sealing, insulation and attic venting are the best methods to stop ice damming from occurring. Spray foam insulation is one modern material that both insulates and seals to stop ice damming. Installed by professionals, spray foam insulation, like that available from Icynene, works well in all climates to completely seal the building, filling every gap to stop air leakage and stop ice dams from forming.

As a long-term solution, spray foam insulation helps maintain a comfortable temperature year round while helping to control monthly heating and cooling ex-

penses. Thanks to spray foam insulation's air-sealing qualities, homeowners can reduce the size of their heat-

ing and cooling equipment since less effort is required to heat or cool the home, according to InsulationS-

mart.com.

While air leakage can cause energy bills to skyrocket and ice damming to occur, a well-insulated home and economical winterizing can help you get through the cold winter months.
